Boosting the life-changing power of universities

Last month, Singapore Management University president Arnoud De Meyer delivered a speech on how much meaningful impact universities have on society. This is an edited version.

For decades, if not centuries, soci-eties all over the world have assumed that universities have a positive so-clo-economic impact on them. Intuitively, societies have a ac-cepted that supplying a well-edu-cated workforce to government and business, and carrying out re-search that ultimately would lead to application, were important for an advanced society. Universities often also offered sig-nificant society. Universities often also offered sig-nificant social mobility, in particu-lar, if they provided public or pri-vate financial support systems and an admission policy that is needs-blind. Finally, universities are often the magnet to attract talented peo-ple as well as excellent intellectual and cultural activities, thereby cre-ated byuniversities were rarely chal-tong to the more taxpayers had to apt for institutes of higher educa-tion, the more there were attempts to quantify these positive effects. And indeed, the impact is posi-tive. The correlations between the 2005 for the university systems and measures of socio-economic de-velopments are positive. The 2018

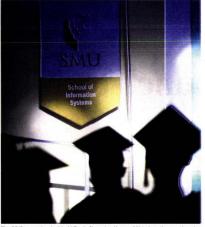

quality of the university systems and measures of socio-economic de-velopments are positive. The 2018 report by the World Bank Group, Changing Nature Of Work, esti-mates that the global average pri-vate return to tertiary education is 15.8 percent. I can also refer to recent analysis by Times Higher Education that suggests that research quality, re-search, and enrolment in tertiary education, correlate quite strongly with factors such as gross national income per capita, or the United Na-tions human development index. During the early 2000s, more voices were raised, in particular in

bices were raised, in particular in the United Kingdom, questioning hether the return on the invest-tion in higher education was

worth it, and whether the impact of university was meaningful rather than marginal. Such questions were raised be-cause of some negative signals. Let me just mention five of them:

Higher education does not always lead to better jobs, and in several countries, from those several countries, from those there is significant graduate unemployment or underemployment. The ideal of education as a significant tool for social mobility has often been challenged. In many countries, it is the children from the better-off families who tend to go to university. Governments did not always see the return on the investment in R&D in the growth of their GDP, and started asking questions about universities' true commitment to commercialisation and monetisation of research outcomes: This was particularly relevant in smaller countries that do not always have the industrial absorptive capacity to bring Higher education does not

do not always have the industrial absorptive capacity to bring research results into practice. While the average return on investment as quoted by the World Bank was 15.8 per cent, the world Bank was 15.8 per cent, de-different situations. The real return depends, of course, on a range of factors that include the quality of the university, student composition, type of disciplines and the availability of jobs. And some politicians, in particular in the United States, doubted whether the public sector should actually be involved in financing research at involved in financing research at universities. They often want to redefine the roles of the state and the markets in the

organisation of universities Such questions led, in the first instance in the UK, to a demand that universities should document and measure their impact. In the 2014 REF (research evalua-tion framework), the UK govern-ment asked universities to docu-

ment their impact through case

Incent state i impact through case studies. This has led to a wealth of case studies, and also sections in the an-nual reports of UK and, more re-cently, US universities, quantify-ing their impact through the num-ber of jobs created, spin-off enter-prises launched, increased salaries for their graduates, growth engen-dered through immigration of in-ternational students, or cultural events supported. How have we been thinking about meaningful impact? We can easily produce a set of ap-

proximate statistics, showing the socio-economic impact of SMU. For example, if our graduates were to get \$1,000 more a month be-cause of their degree, we create ad-ditional value of close to \$360 mil-lion for our 24,000 alumni. Having about 80 start-ups by our graduates each year also makes a significant impact on Singapore. And through community service, our students give back to society about 270,000 hours every year. But I am convinced that like other universities, SMU will have to re-flect a lot more on how we enhance our impact on society.

Hect alot more on how we enhance our impact on society. A university education is more than a set of courses, it is about transforming young adults so that they can make a big difference to our society, once they get on with their jobs. I see four ways of ensur-ing that this happens:

Tertiary education systems need, of course, to guarantee a minimum threshold of transferable cognitive skills. We need to teach our disciplines. But in the World Bank's Changing Nature OFWork, it is also emphasised thanks comparing more general education in tertiary programmes, such as critical thinking, problem solving and communications, renders the acquisition and application of the transferable skills more effective.

Second, in a world where we will live and work longer, formal education is no longer an activity that is limited to a particular period in your life, but should be a continuing activity. And in a period in your life, buts should be a continuing activity. And in a world where we have unlimited access to information and knowledge, it ransfer of knowledge, it and the arring how to apply knowledge. We need to provide a learning environment in which our students learn to learn from project work. Therefore, SMU has invested heavily in experiential learning, our so-called SMU-X. our so-called SMU-X. Third, universities need to provide better integration between learning, living and giving back to society. From this academic year onwards, SMU is piloting a Residential Living-and-Learning concept at our renovated Prinsep Street Residences. We aim to build community of students for the

Residences. we aim to build a community of students for the community around us, where students co-live/work/learn together. They are also nurtured to be change agents by giving back to the Bras Basah community... And fourth, universities need to

remain totally committed to the idea of social mobility. Last year, we created the bond-free SMU Access programme that ensures that no student who comes from that no student who comes from a family with a per capita income of less than \$625 would miss out on an SMU undergraduate education due to the lack of financial resources. Universities need to create an en-vironment where junior faculty can pursue basic research in their disci-plines, partially as a way to build their reputation. But labo count on senior faculty to engage in larger scale interdisciplinary research projects that address the issues we have to coope with here in Singa-pore. We need to come up with solu-tions for our ageing population. We need to find ways to protect us against cyber attacks. We need to in-vest in new models for retail. These are all areas where we build new re-search centres. Universities need to create an en-

vest in new models for retail. These are all areas where we build new re-search centres. But rather than thinking about ap-plication after we have carried out the research. I would encourage fac-ulty to invest more during the de-sign phase of the research projects in what I would call "design for ap-plication". Let's think from the start of a research project on how its out-come can have meaningful impact on our societ" shink from the start of aready referred to the need for life-long learning. A little more than a year ago, SMU and other institu-tions of higher learning here in Sim-gapore created units to respond to he Government's plans for continu-ting education, under the banner of Skills future. But I am convinced that we are still in the early stages of discover-ing how to create meaningful im-pact through adult learning pro-grammes. The whole university world

ing how to create meaningful im-pact through adult learning pro-grammes. The whole university world mediate to invest in having a better understanding of how adults learn, we need to carry out a more system-atic diagnosis of the specific needs and we need to devise flexible deliv-ery models that fit well with adult lifestyles. And finally, I hope to see more in-ternational students on our campus, either as full-time students or for an exchange programme. Having seen the dynamism and commit-ther associations in Indonesia, Myanmar, Hong Kong, several clities in China, Manila, ands on, I am com-vinced that SMU's meaningful im-pact through our international alumni goes far beyond Singapore.
