Retirees, housewives less satisfied with taxis, private-hire cars in 2022

Lee Nian Tjoe Senior Transport Correspondent

Students, housewives, retirees and the unemployed are significantly less satisfied with using taxis and private-hire services to get around

in 2022 than they were in 2021.
But public buses and the MRT

maintained their customer satisfaction score at 2021 levels.

These are among the research findings from the 2022 Customer Satisfaction Index of Singapore published by the Institute of Service Excellence (ISE) at Singapore

Management University.
The findings focused on the land transport sector, which comprises the Mass Rapid Transit sys-tem and public buses as well as

ers various sectors.

taxis and private-hire cars.

This is part of a larger annual study that started in 2007 and cov-Online interviews were con-

ducted with 2,350 local residents between April and July 2022. The level of satisfaction among

non-working commuters for taxis and private-hire cars fell from 76.5 points in 2021 to 72.1 points - a decrease of 5.8 per cent.

When the responses from those who are working were included,

the overall score for taxis and private-hire cars is marginally better than in 2021 - by 0.4 per cent.

Respondents who are not em-ployed gave comparatively lower scores than those who are working, especially when it comes to the perception of value when using taxis and private-hire cars. The level of satisfaction among non-working commuters for taxis and private-hire cars fell from 76.5 points in 2021 to 72.1 points - a decrease of 5.8 per cent. When the responses from those who are working were included, the overall score for taxis and private-hire cars is marginally better than in 2021 - by 0.4 per cent.

Those not working also gave significantly poorer scores than em-ployed respondents when it comes to their level of satisfaction with the "ease of getting a ride" and "waiting for a ride".

Ms Neeta Lachmandas, execu-tive director of ISE, said the scores for taxis and private-hire cars would have been affected by the smaller number of such vehicles on the road and the higher fees

charged by the operators. She added that those who are not working "presumably have a smaller tolerance for such discretionary spending".

The survey period coincided with rising demand for land transport that came with the lifting of pandemic-related restrictions.

The study found that the frequency of services is among the

top drivers of commuters' perception for both the MRT and public

Other key concerns include cleanliness and ride comfort for the MRT, while public bus users rate ease of boarding and moving within buses highly.

In addition, the study found that fewer people are working from home in 2022 than in 2021. The ma-jority have indicated that they will return to the workplace in the next 12 months, suggesting that demand for land transport will rise.

Ms Lachmandas said based on

the findings, transport operators may wish to start calibrating their infrastructure and services to meet the anticipated resurgence in demand.
